

The assessment tool in this section determines an organisation's current AI adoption maturity across six dimensions — people, process, technology, data, culture, and governance, each of which has 5 or more sub-dimensions to analyse.

How the Assessment Works:

The three-evaluator system

No single perspective produces an accurate assessment. Leadership sees strategy and investment; delivery teams see ground-level reality; neither sees the full picture. The three-evaluator system requires the same assessment to be completed by three different roles, producing three independent scores that are then reconciled.

Evaluator 1: Leader

Who fills this: Delivery Lead, VP of Engineering, Head of Technology, or equivalent. The most senior person with responsibility for AI adoption decisions on this engagement or within this business unit.

Strongest on: Strategic dimensions – exec sponsorship, hiring strategy, governance design, budget allocation, AI policy. Dimensions where leadership has direct decision-making authority.

Watch for: Tendency to score intentions rather than current reality, particularly on psychological safety, team skills depth, and sprint health. Scores on these dimensions should be verified by the team lead assessment.

Evaluator 2: Team Lead

Who fills this: Scrum Master, Tech Lead, Engineering Manager, or equivalent. The most senior practitioner with direct visibility of how the delivery team works day to day.

Strongest on: Operational dimensions – sprint health, CI/CD maturity, quality engineering, AI coding tool adoption, incident response. Dimensions where the team lead has direct daily visibility.

Watch for: May lack visibility into governance and compliance dimensions, and may not have full context on leadership's AI strategy or budget decisions. Combine with the leader assessment on these dimensions.

Evaluator 3: Independent Evaluator

Who fills this: An external assessor, a CoE member from a different business unit, or an internal audit representative who has conducted structured interviews with both leadership and practitioners before completing the form. Must not report directly to Evaluator 1 or 2.

Strongest on: All dimensions – the independent evaluator's role is to mediate between the other two assessments using interview evidence. Their score is based on what they observed and heard, not on what they were told to expect.

Watch for: Time investment – meaningful independent evaluation requires at least two to three hours of interviews across leadership and team levels before the form is completed. An independent evaluator who completes the form without interviews is not performing the function the system requires.

Output: Current vs target state heatmap, perception gap report, ROI scenario.
